WO 03/082850 A1

(54) Title: COMPOUNDS FOR THE CONTROLLED RELEASE OF ACTIVE ALDEHYDES

(57) Abstract: The present invention relates to the field of perfumery. More particularly, it concerns an aldoxane derivative of Formula (I) capable of protecting an active aldehyde $R_1\text{CHO}$, for example a perfumery or flavor aldehyde, from a chemically aggressive medium into which they have to be added, and then of releasing said active aldehyde at the desired moment. The present invention concerns also the use of said compound in perfumery or in the flavor industry as well as the compositions or articles associated with said aldoxanes.

COMPOUNDS FOR THE CONTROLLED RELEASE OF ACTIVE ALDEHYDES

Technical field

5

The present invention relates to the field of perfumery and flavor. More particularly, it concerns an aldoxane derivative capable of releasing an active aldehyde, for example a perfumery or flavor aldehyde, at the desired moment. The present invention concerns also the use of said compound in the perfumery or in the flavor industry as well
10 as the compositions or articles associated with said aldoxanes.

Prior art

Aldoxanes are a known family of compounds and, to the best of our knowledge,
15 said compounds have never been described for a controlled release of an aldehyde capable of bringing a benefit or effect into its surrounding environment, e.g. a perfumery or flavor aldehyde.

Aldoxanes have been essentially reported as chemical intermediates, e.g. in the synthesis of surfactants. Of the aldoxanes responding to formula (I), described
20 hereinbelow, and derived from an aldehyde which may be useful in perfumery or in the flavor industry, only the following have been reported in the prior art : 5-methyl-2,6-bis(1-methylethyl)-1,3-dioxan-4-ol, 2,6-diethyl-5-methyl-1,3-dioxan-4-ol, 2,6-dimethyl-1,3-dioxan-4-ol, 6-hexyl-2-(1-methylethyl)-1,3-dioxan-4-ol, 5,5,6-trimethyl-2-(1-methylethyl)-1,3-dioxan-4-ol,
25 5,5-dimethyl-2,6-bis(1-methylethyl)-1,3-dioxan-4-ol, 2,6-dibenzyl-5-phenyl-1,3-dioxan-4-ol, 2-ethyl-6-methyl-1,3-dioxan-4-ol, 2-(1-methylethenyl)-1,3-dioxan-4-ol, 6-hexyl-2-(2-octanol-1-yl)-1,3-dioxan-4-ol and 5-ethyl-2,6-dipropyl-1,3-dioxan-4-ol.

However none of these compounds has been described as being able to release an aldehyde in a controlled manner, nor their use as active ingredient in compositions such as
30 perfuming or flavoring ones has been reported.

Additionally, 2-methyl-1,3-dioxan-4-ol has been reported as being a component of a muscat wine extract (A. Razungles *et al.* in Sci. Aliments, (1994) 14, 725-39), however the prior art is mute regarding its role as well as its behavior as an agent for the release of acetaldehyde.

5

Description of the invention

Surprisingly, we have now discovered that some aldoxane derivatives are capable of releasing an active aldehyde in a controlled manner, as well as of protecting said aldehyde, from a chemically aggressive medium into which it has to be added prior to its release or use. As "active aldehyde" we mean here any aldehyde capable of bringing a benefit or effect into its surrounding environment and in particular any aldehyde of current use in perfumery or in the flavor industry.

The aldoxanes of the invention are of formula

15

wherein R¹ represents an organic residue C_Y, derived from a perfuming or flavoring aldehyde of formula Y₃CCHO, Y being a hydrogen atom, a C₁ to C₂₀ linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; two Y being possibly bonded together to form a saturated, unsaturated or aromatic ring having 5 to 20 carbon atoms, said ring being possibly substituted;

R² represents a R¹ group, a Y group or a C₅ to C₁₀ aromatic ring, said ring possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; and R³ and R⁴ represent each a Y group or are bonded together to form a saturated or unsaturated ring having 5 to 20 carbon atoms, said ring being possibly substituted.

Groups which are possible substituents of Y, R², R³, R⁴, and the rings which are possibly formed, are for example C₁ to C₈ linear, branched or cyclic alkyl or alkenyl groups, possibly containing one heteroatom such as an oxygen.

It is understood that whenever in a compound of formula (I) there are more than one Y group, then each said group may be identical to or different from the other Y groups. The same applies to R¹.

By the expression "perfuming or flavoring aldehyde" it is meant here a compound which is of current use in perfumery or in the flavor industry, i.e. a compound which is used as ingredient in flavoring or perfuming preparations or compositions in order to impart an hedonic effect. In other words, such an aldehyde, to be considered as being a perfuming or flavoring one, must be recognized by a person skilled in the art as being able to impart or modify in a positive and pleasant way the odor or taste of a composition, and not just as having an odor or taste.

Preferred compounds of formula (I) are those wherein R¹, R² and Y are defined as hereinabove; and

R³ represents a C₁ to C₁₆ linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; and

R⁴ represents a Y group or said R⁴ and R³ are bonded together to form a saturated or unsaturated ring having 5 to 15 carbon atoms, said ring being possibly substituted.

More preferred compounds of formula (I) are those wherein:

R¹ represents an organic residue derived from an active aldehyde of formula R¹CHO selected from the group consisting of hydroxycitronellal, citronellal, 3-(4-methoxyphenyl)-2-methylpropanal, the linear C₈ to C₁₂ alkyl aldehydes, 3-(4-isopropylphenyl)-2-methylpropanal, 3-(4-tert-butylphenyl)-2-methylpropanal, 4- and 3-(4-hydroxy-4-methylpentyl)-3-cyclohexene-1-carbaldehyde, 3-(4-tert-butylphenyl)propanal, 3-(1,3-benzodioxol-5-yl)-2-methylpropanal, 2,4-dimethyl-3-cyclohexene-1-carbaldehyde, 3- and 4-(3,3-dimethyl-5-indanyl)propanal, 8(9)-methoxy-tricyclo[5.2.1.0.(2,6)]decane-3(4)-carbaldehyde and 3-phenylbutanal; and

R² represents a R¹ group, a hydrogen atom or a C₁ to C₁₆ linear, branched, cyclic or polycyclic alkyl, alkenyl or alkylaryl hydrocarbon radical, said hydrocarbon radical being

possibly substituted, or a C_5 to C_6 aromatic ring, said ring possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted;

R^3 represents a C_1 to C_{16} linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising
 5 up to three oxygen or nitrogen atoms and being possibly substituted; and

R^4 represents a hydrogen atom or a R^3 group; or said R^4 and R^3 are bonded together to form a saturated or unsaturated ring having 5 to 10 carbon atoms, said ring being possibly substituted.

Yet more preferred are the compounds of formula (I) wherein R^1 is defined as
 10 hereinabove, R^2 and R^3 represent a C_3 to C_{10} linear, branched, cyclic or polycyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, and R^4 represents a hydrogen atom or a methyl or ethyl group.

The compounds of the invention can be synthesized by conventional methods using cheap starting materials. Generally speaking, the compounds of formula (I) are
 15 susceptible of being obtained by a reaction comprising the following step:

a) mixing together, the three aldehydes of the formulae (II), (III) and (IV),

(II)

(III)

(IV)

20 wherein R^1 , R^2 , R^3 and R^4 have the meaning as defined in formula (I),
 in the presence of a base, such as an alkaline hydroxide or C_1 to C_4 alkoxide, and a temperature comprised between -10°C and $+10^\circ\text{C}$, preferably between 0°C and 5°C ,
 and aldehydes (III) and (IV) being in at least an equimolar amount in respect of aldehyde (II); or

25 b) reacting, at a temperature comprised between -10°C and 50°C , preferably between 0°C and 30°C , an active aldehyde (II), as defined hereinabove, with an aldol of formula

wherein R^2 , R^3 and R^4 have the meaning as defined in formula (I),

the latter being susceptible of being obtainable by an aldol reaction between an
 5 aldehyde of formula (III) and an aldehyde of formula (IV).

The methods of synthesis of the aldol of formula (V) are well known to a person skilled in the art of the chemical synthesis.

General examples of this approach are illustrated in Scheme (I):

10 Scheme (I): Examples of synthesis of the compounds of formula (I)

wherein the symbols R^1 , R^2 , R^3 and R^4 have the same meaning as defined in formula (I),

15 and the base may be an alkaline hydroxide or C_1 to C_4 alkoxide.

General examples of such synthesis are described in the literature, e.g C. Chuit, et al. in *Synthesis* 1983, 294-296; R. H. Saunders, et al. in *J. Am. Chem. Soc.* 1943, vol. 65, 1714-1717; G. Fouquet, et al. in *Liebigs Ann. Chem.* 1979, 1591-1601; S. D. Rychnovsky, et al. in *J. Org. Chem.* 1992, vol. 57, 4336-4339; J. L. E. Erickson, et al. in
 20 *J. Am. Chem. Soc.*, 1958, vol. 80, 5466-5469; Spaeth, et al. in *Chem. Ber.* 1943, vol. 76, 1196-1208 or Spaeth et al. in *Chem. Ber.* 1943, vol. 76, 513-520.

The aldehyde of formula (II) was previously defined as being an active aldehyde. The aldehydes of formulae (III) and (IV) are preferably identical, and may also be active aldehydes. Therefore it is possible to prepare an aldoxane of formula (I) using two or even three different active aldehydes. Whenever at least one of said aldehydes of the formulae (III) and (IV) is an active aldehyde, it is understood that they may be identical or different from the active aldehyde of formula (II).

An aldoxane of formula (I) susceptible of being obtained by the reaction of an active aldehyde of formula (II) with an aldol of formula (V), which is obtainable by the condensation of two identical or different aldehydes, is a preferred embodiment of the invention. In such a case, preferably, the aldol of formula (V) is obtained by the condensation of two C₃ to C₁₀ linear or branched aldehydes, more preferably pentanal or hexanal.

The compounds of the invention are capable of releasing an active aldehyde (II) via a decomposition reaction which is believed to be influenced by pH changes and/or heat, but may be triggered by other types of mechanisms. The decomposition reaction is illustrated in Scheme(II):

Scheme (II): Decomposition reaction of the compounds of formula (I)

The decomposition reaction leads also to the release of the aldol (V) as a residue. It has to be pointed out that said residue may be itself a stable molecule or may

decompose into an α,β -unsaturated aldehyde, via elimination of water, or into two molecules of aldehyde, via a retro-aldol reaction.

In the case the residue is a stable molecule, then preferably said residue is an inactive compound, e.g. an odorless aldol.

5 In the case the residue decomposes, then preferably the α,β -unsaturated aldehyde or the two molecules of aldehyde generated by the decomposition are active aldehydes, e.g. perfumery aldehydes. Said embodiment of the invention is of particular interest as it allows, in principle, to achieve a "total mass efficiency", meaning that no residue is generated, opposite to known aldehyde releasing systems such as classical 1,3-dioxanes.

10 The compounds of the invention are composed of two main parts, namely the aldol moiety, derived by the aldol of formula (V), and the active aldehyde moiety, derived by the active aldehyde of formula (II) and which is susceptible of being released.

Although it is not possible to provide an exhaustive list of the currently known active aldehyde of formula (II), the following perfumery or flavor aldehydes can be
15 named as examples:

hydroxycitronellal, 3-(4-methoxyphenyl)-2-methylpropanal, 3,5,5-trimethylhexanal, 5- or 6-octenal, acetaldehyde, the linear C_6 to C_{12} alkyl aldehydes and their α -methyl derivatives, hydratropic aldehyde, phenylacetaldehyde, 3-phenylpropanal, 3-(4-isopropylphenyl)propanal, 3-(4-methylphenyl)propanal, 4- or 6- or 8-nonenal, 9-decenal,
20 3,5-heptadienal, 3,5-nonadienal, 3,5-decadienal, 9-p-menthanal, Phenexal[®] [3-methyl-5-phenylpentanal, origin : Firmenich SA, Geneva, Switzerland], Mugoxal[®] [3-(4-tert-butyl-1-cyclohexen-1-yl)propanal; origin : Firmenich SA, Geneva, Switzerland], 4-dodecenal, 4-decenal, 3,7-dimethyloctanal, citronellal, campholenic aldehyde, formyl pinane, Lilial[®] [3-(4-tert-butylphenyl)-2-methylpropanal; origin : Givaudan-Roure SA, Vernier,
25 Switzerland], Lyrall[®] [4- and 3-(4-hydroxy-4-methylpentyl)-3-cyclohexene-1-carbaldehyde; origin : International Flavors & Fragrances, USA], Bourgeonal[®] [3-(4-tert-butylphenyl)propanal; origin : Quest International, Naarden, Netherlands], heliopropanal [3-(1,3-benzodioxol-5-yl)-2-methylpropanal; origin : Firmenich SA, Geneva, Switzerland], Zestover (2,4-dimethyl-3-cyclohexene-1-carbaldehyde; origin :
30 Firmenich SA, Geneva, Switzerland), Trifernal[®] (3-phenylbutanal; origin : Firmenich

SA, Geneva, Switzerland), (4-methylphenoxy)acetaldehyde, Scentenal[®] [8(9)-methoxy-tricyclo[5.2.1.0.(2,6)]decane-3(4)-carbaldehyde ; origin : Firmenich SA, Geneva, Switzerland], Liminal[®] [(4R)-1-p-menthene-9-carbaldehyde ; origin : Firmenich SA, Geneva, Switzerland], Cyclosal [3-(4-isopropylphenyl)-2-methylpropanal], 3-methyl-5-phenylpentanal, Acropal[®] [4-(4-methyl-3-pentenyl)-3-cyclohexene-1-carbaldehyde], 10-undecenal or 9-undecenal and their mixtures such as the Interleven[®] aldehyde (origin : International Flavors & Fragrances, USA), muguet aldehyde [(3,7-dimethyl-6-octenyl)acetaldehyde ; origin : International Flavors & Fragrances, USA], 2,6-dimethyl-5-heptenal, Precyclemone[®] B [1-methyl-4-(4-methyl-3-pentenyl)-3-cyclohexen-1-carbaldehyde ; origin : International Flavors & Fragrances, USA], Hivernal[®] [3 and 4-(3,3-dimethyl-5-indanyl)propanal; origin : Firmenich SA, Geneva, Switzerland] and Isocyclocitral[®] (2,4,6-trimethyl-3-cyclohexene-1-carbaldehyde ; origin : International Flavors & Fragrances, USA).

The nature of the aldol moiety plays an important role in the release kinetics of the active aldehyde. Indeed, by changing the chemical nature of R², R³ and R⁴, e.g. the length or the branching of said groups, one can fine tune the perfume releasing properties of the aldoxane of the invention.

Furthermore, if the compounds of the invention are intended to be deposited on a surface, e.g. during a washing process, then the specific nature of R², R³ and R⁴ can also play an important role in the effective deposition and surface substantivity of the molecules of the invention on the surface used for the application, especially on fabrics and hair. For instance, sufficiently long and hydrophobic R², R³ and R⁴ groups increase substantially the substantivity of the aldoxane on the surface used for the application.

As previously, it is not possible to provide an exhaustive list of the aldehydes of formulae (III) and (IV) which can be used for the synthesis of the aldol (V) or of the aldoxane of the invention. However, for the aldehydes of formula (III), in addition to the cited aldehydes of formula (II), the following aldehydes can also be named as examples: acetaldehyde, propanaldehyde, butyraldehyde, isobutyraldehyde, pentanal, 3-methylpentanal, 2-methylpentanal, hexanal, heptanal, octanal, nonanal, decanal, dodecanal, 3-phenylpropanal and cyclohexanecarbaldehyde. For the aldehyde of formula

(IV), in addition to the herein above cited compounds of formula (II) or (III), one can name as additional examples: formaldehyde, benzaldehyde, amyl or butyl cinnamic aldehyde, ortho or meta anisic aldehyde, cuminic aldehyde, 4-ethyl benzaldehyde, paratolueneic aldehyde, cinnamic aldehyde, 1,3-benzodioxol-5-carboxaldehyde, 2-tridecenal, 2,6,6-trimethyl-1,3-cyclohexadiene-1-carbaldehyde, citral, vanilline and ethyl vanilline.

We have already mentioned that the aldoxanes of the invention are particularly interesting for their ability to allow a controlled release of active aldehydes into the surrounding environment. We have also mentioned that another valuable advantage of said compounds is their ability to protect the active aldehyde from a chemically aggressive medium into which it has to be added. Yet another advantage of said compounds is that owing to their lower volatility, in respect to the free active aldehyde $R'CHO$, they allow the use in application of highly volatile aldehydes, which are difficult to use because they do not persist. Therefore, the compound of formula (I), being a useful active ingredient, might be advantageously associated with compositions intended for applications such as the perfuming or the flavoring of various products.

In this respect, the present invention concerns also all different forms of the invention's compounds which can be advantageously employed in perfumery or in flavors. Said forms are also an object of the present invention.

In an embodiment of the invention, one of said forms, which can be advantageously employed as perfuming or flavoring ingredient, is a composition of matter consisting of at least a compound of formula (I) and at least one perfumery or flavor carrier. By "perfumery or flavor carrier" we mean here one or more materials which are able to be admixed with an invention's compound without significantly altering its organoleptic properties, e.g. materials which are neutral from a perfumery or flavor point of view. Said carrier may be a liquid or a solid.

As liquid carrier one may cite, as non-limiting examples, an emulsifying system, i.e. a solvent, e.g. water, and a surfactant system, or a solvent commonly used in perfumery or flavors. As examples of solvents commonly used in perfumery, generally speaking, one can cite compounds such as dipropylene glycol, diethyl phthalate, isopropyl myristate, benzyl benzoate, 2-(2-ethoxyethoxy)-1-ethanol or ethyl citrate, which are the

most commonly used. As examples of solvents commonly used in flavors, one can cite compounds such as propylene glycol, triacetine, triethyl citrate, benzylic alcohol, ethanol, vegetal oils or terpenes.

As solid carrier one may cite, as non-limiting examples, an absorbing gum or a polymer, or yet an encapsulating material. Said gums or materials are well known to a person skilled in the art.

In another embodiment of the invention, a suitable form of the compound (I) is a composition of matter comprising at least one compound of formula (I) and a perfume or flavor base. In other words the compound (I) is in the form of a perfuming or flavoring composition. It is understood that the perfuming ingredients are present in a perfuming effective amount.

Generally speaking, by "perfume or flavor base" we mean here a composition comprising at least one perfuming or flavoring co-ingredient and possibly one or more solvents and/or adjuvants commonly used in the perfume or flavor industry.

Said perfuming or flavoring co-ingredients are not of the formula (I) and may be in any of their forms. Moreover, by "perfuming or flavoring co-ingredient" it is also meant here a compound, which is of current use in perfumery or in the flavor industry, i.e. a compound which is used as ingredient in perfuming or flavoring preparation or composition in order to impart an hedonic effect. In other words such a co-ingredient, to be considered as being a perfuming or flavoring one, must be recognized by a person skilled in the art as being able to impart or modify in a positive or pleasant way the odor or taste of a composition, and not just as having an odor or taste. It is therefore understood here that, unless otherwise indicated or described, any mixture resulting from a chemical synthesis in which the compound of the invention is involved as a starting intermediate or as an end-product is not a perfuming or flavoring base according to the invention.

The nature and type of the perfuming or flavoring co-ingredients present in the base do not warrant a more detailed description here, which in any case would not be exhaustive, the skilled person being able to select them on the basis of its general knowledge and according to intended use or application and the desired organoleptic effect. In general terms, these perfuming co-ingredients belong to chemical classes as

varied as alcohols, aldehydes, ketones, esters, ethers, acetates, nitriles, terpene hydrocarbons, nitrogenous or sulphurous heterocyclic compounds and essential oils of natural or synthetic origin. Many of these co-ingredients are in any case listed in reference texts such as the book by S. Arctander, Perfume and Flavor Chemicals, 1969, Montclair, New Jersey, USA, or its more recent versions, or in other works of a similar nature, as well as in the abundant patent literature in the field of perfumery or flavors. It is also understood that said co-ingredients may also be compounds known to release in a controlled manner various types of perfuming or flavoring compounds.

Similarly, a detailed description of the nature and type of solvents commonly used in perfuming or flavoring bases cannot be exhaustive. A skilled person in the art is able to select them on the basis of the nature of the product to be perfumed. However, as non-limiting examples of solvents commonly used in perfumery bases, one can cite, in addition to the solvents mentioned above, also ethanol, water/ethanol mixtures, limonene or other terpenes, isoparaffins such as those known under the trademark Isopar[®] (origin: Exxon Chemical) or glycol ethers and glycol ether esters such as those known under the trademark Dowanol[®] (origin: Dow Chemical Company). As non-limiting examples of solvents commonly used in flavoring bases, one can cite, the same as listed above.

The perfuming or flavoring compositions according to the invention may be a simple mixture of the various co-ingredients and solvents, or also in the form of a biphasic system such as an emulsion or microemulsion. Such systems are well known to a person skilled in the art. In the case of flavoring bases, the latter may also be a simple mixture of flavoring ingredients or also in an encapsulated form as mentioned above.

The possibility to have, in the compositions of matter mentioned above, more than one compound of formula (I) is important as it enables the perfumer or flavorist to prepare accords, perfumes or flavors, possessing the ability to release in a controlled manner more than one perfuming or flavoring aldehyde.

One problem of perfuming ingredients, in any of their forms, present as such in washing compositions is that they can have little staying-power and be consequently often eliminated in the rinsing water or upon drying of surface. Another problem is that said perfuming ingredients, once incorporated into a washing compositions, can also be unstable and be transformed into odor less or bad odorant compounds. These problems

can be solved by using a compound of formula (I), for which we have been able to show, on the one hand, that they possess a surprising stability over storage and staying-power or tenacity on surfaces, especially on textiles, and on the other hand, they may also play the role of "stabilizer" allowing thus the use of chemically fragile or highly volatile aldehydes.

Therefore, the aldoxanes of formula (I), owing to their properties can be incorporated in any application requiring the effect of rapid or prolonged liberation of a fragrant aldehyde as defined hereinabove. In particular, they can be used in functional or fine perfumery, particularly in applications in which the fragrance and the freshness of the ingredients must be effectively imparted to the treated surface during washing well beyond the rinsing and drying processes. Suitable surfaces are, in particular, textiles, hard surface, hair and skin.

One of the chief advantages of the invention resides in the fact that the compounds impart an intense fragrance to the treated surface, produced by a fragrant aldehyde, which would not be detected on said surface over a sufficiently long period if the fragrant aldehyde had been used as it is, i.e. without a precursor.

Therefore, a compound of formula (I), in any of its forms, is a useful perfuming ingredient which can be advantageously used in all the fields of modern perfumery, such as fine perfumery or functional perfumery, to positively impart or modify the odor of a consumer product into which said compound (I) is added.

Consequently, a perfumed article comprising:

- i) at least one compound of formula (I), or any of its forms mentioned above; and
 - ii) a consumer product base,
- is also an object of the present invention.

For the sake of clarity, it has to be mentioned that, by "consumer product base" we mean here an unperfumed consumer product, i.e. a consumable product such as a detergent or a perfume, or a part of said consumer product. Therefore, a perfumed article according to the invention comprises at least a part of the whole formulation corresponding to a desired consumer product, e.g. a detergent, and an olfactive effective amount of at least an invention's compound, possibly together with one or more perfuming co-ingredient, solvent and/or adjuvant.

Suitable unperfumed consumer products comprise solid or liquid detergents and fabric softeners as well as all the other articles common in perfumery, namely perfumes, colognes or after-shave lotions, perfumed soaps, shower or bath salts, mousses, oils or gels, hygiene products or hair care products such as shampoos, body-care products, deodorants or antiperspirants, air fresheners and also cosmetic preparations. As detergents are intended applications such as detergent compositions or cleaning products for washing up or for cleaning various surfaces, e.g. intended for textile, dish or hard-surface treatment, whether they are intended for domestic or industrial use. Other perfumed articles are fabric refreshers, ironing waters, papers, wipes or bleaches.

10 Preferred unperfumed consumer products are fabric detergents or softener bases.

Some of the above-mentioned consumer product bases may represent an aggressive medium for the invention compounds, so that it may be necessary to protect the latter from premature decomposition, for example by encapsulation.

The nature and type of the constituents of the consumer product do not warrant a more detailed description here, which in any case would not be exhaustive, the skilled person being able to select them on the basis of its general knowledge and according to the nature and the desired effect of said product. However, as typical examples of fabric detergents or softener compositions into which the compounds of the invention can be incorporated, one may cite the one described in WO 97/34986 or in US patents 4,137,180 and 5,236,615 or EP 799 885. Other typical detergent and softening compositions which can be used are described in works such as Ullman's Encyclopedia of Industrial Chemistry, vol. A8, pages 315-448 (1987) and vol. A25, pages 747-817 (1994); Flick, Advanced Cleaning Product Formulations, Noye Publication, Park Ridge, New Jersey (1989); Showell, in Surfactant Science Series, vol. 71: Powdered Detergents, Marcel Dekker, New York (1988); Proceedings of the World Conference on Detergents (4th, 1998, Montreux, Switzerland), AOCS print.

The proportions in which the compounds according to the invention can be incorporated into the various aforementioned products vary within a wide range of values. These values are dependent on the nature of the article or product to be perfumed and on the desired olfactory effect as well as the nature of the co-ingredients in a given

composition when the compounds according to the invention are mixed with perfuming co-ingredients, solvents or additives commonly used in the art.

For example, typical concentrations are in the order of 0.01% to 50% by weight, or even more, of these compounds based on the weight of the composition into which they are incorporated. Concentrations in the order of 0.001% to 5% by weight can be used when these compounds are applied directly in the perfuming of the various consumer products mentioned hereinabove.

As previously mentioned, a compound of formula (I) is also a useful flavoring ingredient which can be advantageously incorporated into flavored article to positively impart, or modify, the taste of said article. Consequently, a flavored article comprising:

- i) at least one compound of formula (I), or any of its forms above-mentioned; and
- ii) a foodstuff base,

is also an object of the present invention.

Suitable foodstuffs, e.g. foods or beverages, include products such as such as, for examples, dry powder or concentrated compositions for instant beverages, such as fruit juices or hot soups, chewing gum and baking applications such as cake mixes or cookie dough.

The nature and type of the constituents of the foodstuffs or beverages do not warrant a more detailed description here, which in any case would not be exhaustive, the skilled person being able to select them on the basis of its general knowledge and according to the nature of said product.

The present invention relates also about the use of an invention's compound as perfuming or flavoring ingredient. In other words it concerns a method to confer, enhance, improve or modify the odor or flavor properties of a perfuming or flavoring composition or of a perfumed or flavored article, which method comprises adding to said composition or article an effective amount of at least a compound of formula (I). By "use of a compound of formula (I)" it has to be understood here also the use of the compound (I) in any of its forms which can be advantageously employed in perfumery or in flavors as active ingredients. Another object of the invention is the use of a compound of formula (I) as a precursor capable of liberating an active aldehyde, e.g. a perfuming aldehyde, or a

mixture thereof. Said use being particularly attractive when it occurs in an aggressive medium, i.e. a medium in which the active aldehyde as such will be chemically unstable.

Yet another object of the present invention relates to a process for the perfuming of a surface or a process for intensifying, prolonging or deferring the diffusion effect of the characteristic fragrance of a fragrant aldehyde on a surface, characterized in that said surface is treated in the presence of a compound of formula (I), as defined above. Suitable surfaces are, in particular, textiles, hard surfaces, hair and skin. Preferably, the compound of formula (I) is comprised in an appropriate composition or article cited above.

The invention will now be described in further details by way of the following examples, wherein the abbreviations have the usual meaning in the art, the temperatures are indicated in degrees centigrade ($^{\circ}\text{C}$); ^1H -NMR spectral data were recorded at 360MHz and ^{13}C NMR spectra were recorded at 90 MHz in CDCl_3 , the chemical displacement δ are indicated in ppm with respect to the TMS as standard, the coupling constants J are expressed in Hz. Fractional distillations were performed with a 10 cm Vigreux column. All GC analysis were performed on the acetates derivatives of the final products. The acetates derivatives were prepared by mixing the sample with an acetylating reagent at a 1:4 volume ratio in a GC vial; the acetylating reagent was prepared by mixing 1 ml each of acetic anhydride and pyridine and 50 mg of 4-(dimethylamino)pyridine (DMAP). GC-FID analyses were performed with a 30 m capillary column (ID 0.32 mm) coated with 5%-diphenyl-95%-dimethylsiloxane copolymer (0.32 μm film thickness). GC-MS analyses were conducted using either a Hewlett-Packard 5989A or HP 6890 mass spectrometer operated with an ionization energy of 70eV and a mass detection range sufficient to detect the molecular ion of the compound of interest. All aldoxane MS data was obtained using the acetate derivatives.

25

Example 1

Preparation of aldoxanes by the self-reaction of three identical aldehydes

30 *General KOH-Catalyzed Procedure*

An aqueous 10% KOH solution (10-15 mole % KOH on the aldehyde) was cooled to 0°C . The aldehyde was added dropwise at a rate to keep the temperature of the reaction mixture

below 5°C. The reaction mixtures were stirred with an overhead stirrer, generally 15-20 hours, while being maintained at or below 5°C. In the case the reaction medium solidified diethyl ether was added to these mixtures to keep it liquid. While still cold, the aqueous and organic phases of the reaction mixtures were separated. The aqueous phase was
5 extracted with diethyl ether. The combined organic phases were washed with water until the aqueous phase was neutral. The organic phases were dried over Na₂SO₄, filtered and concentrated on a rotary evaporator. Residual solvent was further removed under vacuum to yield the aldoxane in 90-99% yield. Using this procedure, aldoxanes were obtained using butanal (a), isobutanal (b), pentanal (c), isovaleraldehyde (d), hexanal (e), octanal
10 (f), decanal (g), phenylacetaldehyde (h), 3-phenylpropanal (i), and 2-phenylpropanal (j), heptanal (k) and 9-undecenal (l). The aldoxanes obtained from butanal, isobutanal, pentanal, hexanal, heptanal and 9-undecenal were liquid at ambient temperature, all the others were solids or semi-solids.

GC-FID and GC-MS analyses showed that the mixtures were composed predominantly of
15 the desired aldoxane. Mass spectral data is reported for the most prominent aldoxane isomer. IR spectroscopy also confirmed the aldoxane structure, showing a strong O-H absorption band and only a weak carbonyl absorption, if any, and strong bands in the C-O stretching region.

Example 2

Preparation of aldoxanes by the self-reaction of two different aldehydes

30

a) **2-Pentyl-5-butyl-6-phenyl-1,3-dioxan-4-ol**

Benzaldehyde (5 grams, 0.047 moles) and methanol (5 ml) were added to a flask, and the mixture cooled with a 0°C cold bath. Sodium methoxide (1 gram, 25% methanolic solution, 4.6 mmoles) was added, followed by the dropwise addition of 9.4 grams of

hexanal. The reaction mixture was stirred for four hours. Diethyl ether (100 ml) and water (25 ml) were added and the water phase was washed with 50 ml of diethyl ether. The ether phases were combined and washed with water (3 x 50 ml) until the aqueous phase was neutral. The ether phase was dried over Na_2SO_4 , filtered and concentrated on a rotary evaporator yielding 12.3 g (85% yield) of a colorless, viscous liquid. GC-MS analysis showed the major component was 2-pentyl-5-butyl-6-phenyl-1,3-dioxan-4-ol (at least two isomers). Also found in the product were benzaldehyde, hexanal, the aldoxane of hexanal (see example 1e) and the 2-butylcinnamic aldehyde.

IR (film): 3418 (s, broad), 2957 (s), 2932 (s), 2862 (s), 1705 (w), 1457 (m), 1140 (s) cm^{-1} .

MS: 347 ($\text{M}^+ - 1$, <1), 289 ($\text{M}^+ - \text{MeCO}_2$, 1), 248 (8), 189 (36), 160 (15), 142 (38), 91 (82), 82 (55), 43 (100).

b) 2,6-Dipentyl-5-methyl-5-phenyl-1,3-dioxan-4-ol

A mixture of hydratropic aldehyde (13.4 grams, 0.1 moles), hexanal (20 grams, 0.2 moles) and diethyl ether (50 ml) was added dropwise to 11 ml of a cold (0°C) 10% KOH solution. The mixture was stirred an additional 15 hours at 0°C. The mixture was added to a separatory funnel and the aqueous phase removed. The organic phase was washed with water until the pH of the aqueous phase was neutral. The ether phase was dried over Na_2SO_4 , filtered and concentrated on a rotary evaporator yielding 28.4 g (85% yield) of a colorless, viscous liquid. GC-MS analysis showed the major component was 2,6-dipentyl-5-methyl-5-phenyl-1,3-dioxan-4-ol. The isomer formed from the hexanal aldol adding to hydratropic aldehyde, 2-(1-phenylethyl)-5-butyl-6-pentyl-1,3-dioxan-4-ol (example 5.5.12), could only be found by extracted ion analysis using ions 183 and 225 of the total ion chromatogram. It was present at a very low level relative to the major product.

Detected in minor amounts were the aldoxane of hexanal (see example 1d) and the aldoxane 2-(1-phenylethyl)-6-pentyl-5-methyl-5-phenyl-1,3-dioxan-4-ol.

IR (film): 3425 (s, broad), 2955 (s), 2931 (s), 2861 (m), 1725 (w), 1603 (w), 1465 (m), 1143 (m), 1113 (m) cm^{-1} .

MS: 375 ($\text{M}^+ - 1$, 1), 305 ($\text{M}^+ - 71$, 1), 217 (2), 188 (36), 176 (56), 134 (100), 118 (30), 43 (41).

Example 3

Synthesis of some homo-aldols of formula (V)

5 *General Procedure*

Typically, adipic acid (1-2 wt%) was added to an aldoxane obtained as described in Example 1 (2,6-diethyl-5-methyl-1,3-dioxane-4-ol was obtained according to Chuit et al. in Synthesis 1983, 294). The sample was then fractionally distilled *in vacuo*. Initially, the aldehyde liberated from the decomposing aldoxane was removed as the distillation flask
10 was heated. Upon removal of the aldehyde, the aldol was obtained by distillation. Aldols were collected in receiving flasks cooled with a dry ice/acetone slurry to minimize dimerization. In this manner the aldols of propanal (a), butanal (b), isobutanal (c), pentanal (d) and hexanal (e) were isolated. Yields are based on amount of aldehyde used to make the crude aldoxanes. For the aldol of heptanal, 1 wt% Amberlite® IRC-50 (acidic
15 ion exchange resin) was added to the aldoxane (3f) and the distillation conducted using a Kugelrohr distillation apparatus. Heptanal was removed at an oven temperature of 60°C under vacuum (4 Pa) followed by distillation of the aldol at an oven temperature of 110°C (3.3 Pa).

IR spectroscopy confirmed the aldol structure, showing a strong O-H absorption as well
20 as a strong carbonyl absorption.

a. Propanal aldol (3-hydroxy-2-methylpentanal): Yield = 54%

B.p.: 73-77°C/10 mbar

IR (film): 3430 (broad, s), 1722 (s) cm⁻¹.

25

b. Butanal aldol (3-hydroxy-2-ethylhexanal): Yield = 50%

B.p.: 78-83°C/7.3 Pa

IR (film): 3430 (broad, s), 1719 (s) cm⁻¹.

30

c. Isobutanal aldol (3-hydroxy-2,2,4-trimethylpentanal): Yield = 52%

B.p.: 86-87°C, 12 mbar

IR (film): 3478 (broad, s), 1718 (s) cm⁻¹.

¹H-NMR: 9.64 (1H, s), 3.54 (1H, d, J= 4 Hz), 2.44 (1H, br s), 1.87 (1H, m), 1.13 (3H, s), 1.11 (3H, s), 0.96 (3H, d, J= 6.7 Hz), 0.91 (3H, d, J= 6.7 Hz);

¹³C-NMR: 207.0 (d), 80.3 (d), 50.6 (s), 30.0 (d), 21.7 (q), 19.8 (q), 18.7 (q), 17.3 (q).

5 **d. Pentanal aldol (3-hydroxy-2-propylheptanal): Yield = 55%**

B.p.: 72-76°C/6 Pa

IR (film): 3437 (broad, s), 1720 (s) cm⁻¹.

e. Hexanal aldol (3-hydroxyl-2-butyloctanal): Yield = 40%

10 B.p.: 103-104°C/2.6 Pa

IR (film): 3448 (broad, s), 1722 (s) cm⁻¹.

f. Heptanal aldol (3-hydroxyl-2-pentylnonanal): Yield = 53%

B.p.: 110°C/3.3 Pa (Kugelrohr distillation apparatus)

15 IR (film): 3448 (broad, s), 1721 (m) cm⁻¹.

Example 4

Synthesis of some hetero-aldol of formula (V)

20

a) 2,2-Dimethyl-3-hydroxypropanal

Isobutyraldehyde (100 g, 1.39 moles), paraformaldehyde (25 g, 0.83 moles) and water (50 ml) were added to a three-necked, round-bottomed flask equipped with over-head stirrer, thermometer and addition funnel. The mixture was cooled in a cold bath to 5°C or less. An aqueous 10% KOH solution (25 ml) was added dropwise over a 90-minute period and then 200 ml of diethyl ether was added, the reaction mixture stirred 18 hours. Diethyl ether (200 ml) was added and the organic phase was extracted with water until the aqueous phase was neutral. The ether phase was dried over Na₂SO₄, filtered and concentrated on a rotary evaporator. Adipic acid (2 g) was added and the residue was
30 distilled using a short path distillation head. Warm water (70°C) was circulated through the distillation head condenser to prevent the distillate from crystallizing. 65 g of

2,2-dimethyl-3-hydroxypropanal (0.64 moles, 77% yield based on paraformaldehyde) was collected in a flask cooled in a dry ice/acetone bath to prevent dimerization.

Bp: 65-70°C, 10 mbar

5 IR (film): 3425 (broad, s), 1727 (s), 1052 (s) cm^{-1} .

b) 2,2-Dimethyl-3-hydroxybutanal

Isobutyraldehyde (62 g, 0.86 moles), acetaldehyde (76 g, 1.72 moles) and diethyl ether (50 ml) were added to a three-necked round-bottomed flask equipped with a thermometer
10 and addition funnel. The mixture was cooled in an ice bath to $<5^{\circ}\text{C}$. An aqueous 10% KOH (30 ml) solution was added dropwise over a three-hour period and the reaction mixture stirred an additional two hours. Diethyl ether (200 ml) was added to the cold reaction mixture, the organic phase was extracted with water until the aqueous phase was neutral. The ether phase was dried over Na_2SO_4 , filtered and concentrated on a rotary
15 evaporator. Adipic acid (1.5 g) was added to the residue. The sample was fractionally distilled yielding 40.5 g (0.35 moles, 40.6% yield based on isobutyraldehyde) of 2,2-dimethyl-3-hydroxybutanal as a colorless liquid. The aldol was collected in receiving flasks cooled with a dry ice/acetone slurry to minimize dimerization.

20 B.p. 67-70°C, 15 mbar

IR(film): 3445 (broad, s), 1721 (s) cm^{-1} .

Example 5

25 Synthesis of aldoxanes from aldols of formula (V) and an aldehyde of formula (II)

6-Ethyl-2,5-dimethyl-1,3-dioxan-4-ol

Freshly distilled 3-hydroxy-2-methylpentanal (Example 3a, 20 g 0.172 moles) and 15 g (0.34 moles) of acetaldehyde were mixed at ambient for one day. Excess acetaldehyde
30 was removed on a rotary evaporator. Fractional distillation of the remaining residue

yielded 15.8 g of 6-ethyl-2,5-dimethyl-1,3-dioxan-4-ol (0.099 moles, 57% yield) as a mixture of at least three diastereomers.

Bp: 51-57°C, 2.6 Pa

- 5 IR (film): 3422 (s, broad), 1720 (w), 1149 (s), 1112 (s), 981 (m), 947 (m) cm^{-1} .
MS: 202 (M^+ , <1), 201 (M^+-1 , 4), 187 (3), 159 (5), 158 (5), 143 (M^+-MeCO_2 , 35), 100 (75), 99 (46), 70 (75), 43 (100).

General procedure

- 10 Following the same type of procedure described hereinabove, the freshly distilled aldol, obtained such as described in examples 3 and 4, and the desired aldehyde R^1CHO were weighed into a flask and stirred for at least one day at ambient temperature (molar ratio used according to table 1 to 7). The composition of the reaction mixtures was assessed by GC-FID and GC-MS analysis of the acetate derivatives. The desired aldoxane was the
15 major product formed in all the experiments listed. Minor components were the aldol dimer and unreacted aldehyde. Characterizing MS fragments (of the acetate derivative) are listed in the tables and the data are generally for the most abundant aldoxane isomer formed. The fragments ions listed are the molecular ion (M^+), M^+-1 ion, M^+-R^1 (R^1 of formula I) and M^+-59 (loss of acetate radical). Generally, the reaction mixtures were
20 viscous liquids although several did crystallize (particularly those prepared with phenylacetaldehyde and Zestover). Aldoxanes prepared in this manner were used without further purification.

a) Aldoxanes from homo-aldols of formula (V)

- 25 Using the above general procedure, aldoxanes were synthesized from several perfumery aldehydes and propanal aldol (example 3a), see table 1; butanal aldol (example 3b), see table 2; isobutanal aldol (example 3c), see table 3; pentanal aldol (example 3d), see table 4; and hexanal aldol (example 3e), see table 5; and heptanal aldol (example 3f), see table 5a.

Table 1 : Aldoxanes formed with propanal aldol

 10 and in the above column it is specified only the name of the R¹ radical.

Example 6

Thermal-release of aldehydes

15

a) Thermolysis of 2,6-dibuty-5-pentyl-1,3-dioxan-4-ol

In a typical experiment 8.7 g of pentanal aldol (example 3d) (0.05 moles) and 3.4 g of pentanal (0.04 moles) were mixed into a three-necked 100 ml flask with magnetic stir bar and gas outlet. The mixture was stirred at least two days to allow formation of the
 20 aldoxane. The total weight of the vessel and mixture was recorded. The gas outlet was connected to a series of three cold traps cooled with dry ice/acetone slurries. The mixture then was placed in an oil bath at the desired temperature and well stirred. Nitrogen was bubbled into the mixture (280 ml/min) through a needle. Periodically the vessel was

removed from the oil bath and weighed. The weight difference was divided by the mass of pentanal added to determine percentage of pentanal released (i.e. a loss of 3.4 g = 100% pentanal released, see Table 7). GC-MS analysis of the material collected in the cold traps confirmed that the latter was composed almost exclusively of pentanal. Minor materials detected were pentanoic acid, 2-propyl-2-heptenal and the pentanal aldol. At the end of the measurements, the residue in the flask was set at room temperature for one day and then analyzed by GC-MS as the acetate derivative and found to be the aldol dimer with only a trace of the original aldoxane present.

10 Table 7 : Percentage of pentanal released from the aldoxane obtained by the reaction between the pentanal aldol and pentanal

24			43	13
48				16

1) average of the results obtained on two separated experiments

15

b) Thermolysis of 2,6-dipentyl-5-methyl-5-phenyl-1,3-dioxan-4-ol

Ten grams of the compound described in Example 2b were added to a three-necked, 100 ml flask and heated at 80°C as described above in example 6a. After seven hours,

2.4 grams of material had distilled from the flask. IR and GC-MS analysis showed this material was hexanal with only a small amount of hydratropic aldehyde (hexanal:hydratropic aldehyde GC-FID area ratio 99.4:0.6). In a second experiment, 10 grams of the aldoxane was treated in the same manner for 24 hours. Four grams of volatile material was distilled from the flask. IR and GC-MS analysis showed this material was composed predominantly of hexanal and hydratropic aldehyde (GC-FID area ratio 87:13, respectively).

Example 7

Test on cloth

Portions of unfragranced Downy liquid fabric softener (Procter & Gamble, Cincinnati, Ohio) were dosed with either 0.1% (w/w) of the selected aldehyde or an amount of the corresponding aldoxane, equivalent to 0.1% aldehyde, and obtained as described in Example 5 (e.g., 2-heptyl-5-propyl-6-butyl-1,3-dioxan-4-ol, example 5 N° 5.4.1, was used at 0.22% in the fabric softener). Cotton terry wash clothes and towels (weight about 2 kg) were washed in a top-loading washing machine using an unfragranced, liquid laundry detergent (Tide Free, Procter & Gamble). A hot water wash with cold water rinse was used. 35 grams of the fabric softener was placed in the liquid fabric conditioner dispenser in each washing machine at the start of the wash. At the end of the wash, the towels were dried in a tumble drier (60 minutes). The dry towels were wrapped in aluminum foil for storage at room temperature prior to evaluations. Pair-difference tests were performed comparing towels treated with an aldoxane against towels treated with the corresponding free aldehyde. Panelists were asked to choose the sample with the stronger odor. Statistical analysis was done using a two-tailed paired comparison test. Results are summarized in Table 8.

Table 8 : Test between aldoxane-treated and aldehyde-treated fabric for odor strength

Aldoxane N° ^{a)}	Level in Fabric Softener ^{b)}	Days after Laundering	Number of Panelist	Panelist Choosing Aldoxane-Treated Fabric as Stronger
5.4.1	0.22%	2	6	6
5.4.4	0.18%	3	6	6
5.4.4	0.18%	9	30	27
5.4.10	0.22%	2	6	5
5.4.10	0.22%	8	30	21
5.4.11	0.20%	3	6	6
5.4.11 ^{c)}	0.20%	2	30	27
5.4.11	0.20%	9	30	21
5.4.18	0.20%	1	6	6
5.4.18	0.20%	2	30	20
5.4.18	0.20%	7	30	21
5.4.14	0.19%	1	6	6

a) aldoxane N°: corresponds to the same numbering as in example 5.

5 b) weight percentage; equivalent to 0.1 % of free aldehyde

c) fabric softener one-month old.

Example 8

10 Test on cloth

A) Two liquid fabric softener samples were prepared using an unfragranced fabric softener containing either 0.2% (w/w) of Zestover or 0.45% of 2-(2,4-dimethyl-3-cyclohexenyl)-5-propyl-6-butyl-1,3-dioxan-4-ol (Zestover precursor, example 5
15 N°5.4.17). The formula of the fabric softener was: 16.7% Stepanex VS 90 (Stepan

Company, Northfield, IL, USA), 0.2% of a 10% aqueous CaCl_2 solution, 0.3% colorant (1% aqueous solution of Blue Sandolan, origin: Clariant), 82.8% deionized water, percentage being relative to the total weight.

Thirty-five small cotton towels (46x38 cm, load weight about 2.5 kg) were washed in a top-loading washing machine using an unfragranced, liquid laundry detergent (Tide Free, Procter & Gamble). A warm-water wash with cold-water rinse was used. 30 grams of fabric softener were added to the washing machine as it was filling for the final cold-water rinse. The fabric was tumble-dried for about 43 minutes. Each towel was placed in an individual plastic bin with a lid.

- Both the aldoxane-treated and aldehyde-treated fabric were evaluated for odor strength on a 9-point scale (1=no odor; 9=extremely strong). Each sample was evaluated daily for seven days after washing by a panel of the same forty-four individuals. The first evaluation was done the day of washing (day 0). The data obtained for each day was merged and the mean odor strength ratings compared using t-tests.
- The aldoxane-treated fabric was significantly stronger than the aldehyde-treated fabric on each day of the evaluation, at a confidence interval of 99.8% or greater. The odor strength rating for each sample over the seven days is presented in Table 9.

Table 9 : Odor Strength Rating of Aldehyde-Treated vs. Aldoxane-Treated Cotton Fabric

20

Day	Number of evaluations	Mean Strength Rating (Std. Dev.)	
		aldehyde-treated	aldoxane-treated
0	130	2.03 (1.21)	4.26 (2.00)
1	86	2.10 (1.37)	3.66 (1.77)
3	82	1.93 (1.17)	3.56 (1.93)
4	84	1.89 (1.18)	3.11 (1.95)
5	84	1.70 (1.00)	3.23 (1.67)
6	82	1.69 (1.07)	3.05 (1.68)
7	127	1.81 (1.12)	2.91 (1.65)

(value in brackets represent the standard deviation)

B) When, instead of the above mentioned aldoxane and corresponding perfuming aldehyde were used 0.45% w/w 2-methylundecanal aldoxane (see example 5, N°5.5.11) and 0.2% w/w 2-methylundecanal, the results obtained were as reported in table 10:

5 Table 10: Odor Strength Rating of Aldehyde-Treated vs. Aldoxane-Treated Cotton Fabric

Day	Number of evaluations	Mean Strength Rating (Std. Dev.)	
		aldehyde-treated	aldoxane-treated
0	24	3.17 (1.83)	4.5 (2.04)
3	23	3.04 (1.97)	5.0 (2.10)
7	24	3.13 (1.96)	4.17 (2.01)

(value in brackets represent the standard deviation)

10 C) When, instead of the above mentioned aldoxane and corresponding perfuming aldehyde were used 0.45% w/w 9-undecenal aldoxane (see example 5, N°5.4.9) and 0.2% w/w 9-undecenal, the results obtained were as reported in table 11:

Table 11: Odor Strength Rating of Aldehyde-Treated vs. Aldoxane-Treated Cotton Fabric

15

Day	Number of evaluations	Mean Strength Rating (Std. Dev.)	
		aldehyde-treated	aldoxane-treated
0	23	3.35 (1.85)	2.61 (1.50)
3	25	2.76 (1.51)	3.84 (1.84)
7	25	2.32 (1.41)	3.40 (1.83)

(value in brackets represent the standard deviation)

20 D) When, instead of the above mentioned aldoxane and corresponding perfuming aldehyde were used 0.45% w/w aged Zestover-aldoxane (see, example 5 N°5.4.17) and 0.2% w/w aged Zestover ("aged" means that liquid fabric softeners containing either Zestover aldoxane or Zestover were stored for 8 weeks at 45°C), the results obtained were as reported in table 12:

Table 12 : Odor Strength Rating of Aldehyde-Treated vs. Aldoxane-Treated Cotton Fabric

Day	Number of evaluations	Mean Strength Rating (Std. Dev.)	
		aldehyde-treated	aldoxane-treated
0	134	1.91 (1.16)	2.50 (1.57)
1	89	1.96 (1.26)	2.62 (1.50)
2	88	2.00 (1.07)	2.40 (1.25)
3	90	1.94 (0.92)	2.30 (1.17)
4	86	2.03 (1.23)	2.33 (1.27)
5	87	1.74 (0.90)	2.31 (1.37)
6	85	1.93 (1.33)	2.19 (1.39)
7	130	1.97 (1.13)	2.12 (1.37)

(value in brackets represent the standard deviation)

5

Example 9

Dryer sheets were prepared according to methods known in the art containing either 2.2% MNA aldoxane (example 5 N°5.5.10) or a mixture of 1% MNA in dryer sheet base; namely, DXP 3505 002C Ester Quat made by Goldschmidt. The base containing aldoxane or aldehyde was then coated onto dryer sheets (1.7g base per 0.7g of dryer sheet cut into 16x139 cm sheets).

Thirty-five small cotton towels (46x38 cm, load weight about 2.5 kg) were washed in a top-loading washing machine using an unfragranced, liquid laundry detergent (Tide Free, Procter & Gamble). A warm water wash with cold water rinse was used. The fabric was then tumble-dried for about 43 minutes with the above respective fabric-softening sheet. Each towel was placed in an individual plastic bin with a lid.

Both the aldoxane-treated and aldehyde-treated fabric were evaluated for odor strength by a panel of 15 individuals. 14 of said panelist chosen the aldoxane-treated towels as being the strongest. This finding is statistically significant at a 99.9% confidence limit.

Claims

1. A composition of matter comprising at least one compound of formula

5

wherein R^1 represents an organic residue CY_3 derived from a perfuming or flavoring aldehyde of formula Y_3CCHO , Y being a hydrogen atom, a C_1 to C_{20} linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; two Y being possibly bonded together to form a saturated, unsaturated or aromatic ring having 5 to 20 carbon atoms, said ring being possibly substituted;

R^2 represents a R^1 group, a Y group or a C_5 to C_{10} aromatic ring, said ring possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; and R^3 and R^4 represent each a Y group or are bonded together to form a saturated or unsaturated ring having 5 to 20 carbon atoms, said ring being possibly substituted; and a perfume or flavor base; provided that muscat wine extracts are excluded.

2. A composition of matter according to claim 1, characterized in that in the active ingredient of formula (I)

R^1 , R^2 and Y are defined as in claim 1; and R^3 represents a C_1 to C_{16} linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; and R^4 represents a Y group or said R^4 and R^3 are bonded together to form a saturated or unsaturated ring having 5 to 15 carbon atoms, said ring being possibly substituted.

25

3. A composition of matter according to claim 1, characterized in that in the active ingredient of formula (I) .

R¹ represents an organic residue derived from an active aldehyde of formula R¹CHO selected from the group consisting of hydroxycitronellal, citronellal, 3-(4-methoxyphenyl)-2-methylpropanal, the linear C₈ to C₁₂ alkyl aldehydes, 3-(4-isopropylphenyl)-2-methylpropanal, 3-(4-tert-butylphenyl)-2-methylpropanal, 4- and 3-(4-hydroxy-4-methylpentyl)-3-cyclohexene-1-carbaldehyde, 3-(4-tert-butylphenyl)propanal, 3-(1,3-benzodioxol-5-yl)-2-methylpropanal, 2,4-dimethyl-3-cyclohexene-1-carbaldehyde, 3- and 4-(3,3-dimethyl-5-indanyl)propanal, 8(9)-methoxy-tricyclo[5.2.1.0.(2,6)]decane-3(4)-carbaldehyde and 3-phenylbutanal; and

R² represents a R¹ group, a hydrogen atom or a C₁ to C₁₆ linear, branched, cyclic or polycyclic alkyl, alkenyl or alkylaryl hydrocarbon radical, said hydrocarbon radical being possibly substituted, or a C₅ to C₆ aromatic ring, said ring possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted;

R³ represents a C₁ to C₁₆ linear, branched, cyclic or poly-cyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, said hydrocarbon radical possibly comprising up to three oxygen or nitrogen atoms and being possibly substituted; and

R⁴ represents a hydrogen atom or a R³ group; or said R⁴ and R³ are bonded together to form a saturated or unsaturated ring having 5 to 10 carbon atoms, said ring being possibly substituted.

4. A composition of matter according to claim 1, characterized in that in the active ingredient of formula (I) R¹ is defined as in claim 3, R² and R³ represent a C₃ to C₁₀ linear, branched, cyclic or polycyclic saturated, unsaturated, aromatic or alkylaryl hydrocarbon radical, and R⁴ represents a hydrogen atom or a methyl or ethyl group.

5. A composition of matter according to claim 1, characterized in that the active ingredient of formula (I) is susceptible of being obtained by a reaction comprising the following step:

a) mixing together, the three aldehydes of the formulae (II), (III) and (IV),

wherein R^1 , R^2 , R^3 and R^4 have the meaning as defined in formula (I),

in the presence of a base, such as an alkaline hydroxide or C_1 to C_4 alkoxide, and a

5 temperature comprised between -10°C and $+10^\circ\text{C}$, preferably between 0°C and 5°C ,
and aldehydes (III) and (IV) being in at least an equimolar amount in respect of
aldehyde (II); or

b) reacting, at a temperature comprised between -10°C and 50°C , preferably between
 0°C and 30°C , an active aldehyde (II), as defined hereinabove, with an aldol of
10 formula

wherein R^2 , R^3 and R^4 have the meaning as defined in formula (I), the latter being
susceptible of being obtainable by an aldol reaction between an aldehyde of
15 formula (III) and an aldehyde of formula (IV).

6. A composition of matter consisting of at least a compound of formula (I),
as defined in claim 1, and at least one perfumery or flavor carrier.

20 7. A perfumed article comprising:

- i) at least one compound of formula (I), as defined in claim 1, or a composition as
defined in claim 1 or 6; and
- ii) a consumer product base.

25 8. A perfumed article according to claim 6, characterized in that said
consumer product base is in the form of a solid or liquid detergent, a fabric softener, a

perfume, a cologne, an after-shave lotion, a perfumed soap, a shower or bath salt, mousse, oil or gel, a hygiene product, a hair care product, a shampoo, a body-care product, a deodorant, an antiperspirant, an air freshener, a cosmetic preparation, a fabric refresher, an ironing water, a paper, a wipe or a bleach.

5

9. A flavored article comprising:

- i) at least one compound of formula (I), as defined in claim 1, or a composition as defined in claim 1 or 6; and
- ii) a foodstuff base.

10

10. A flavored article according to claim 9, characterized in that said foodstuff base is in the form of a dry powder or concentrated composition for instant beverage, a chewing gum or a baking application.

15

11. A compound of formula (I) as defined in any one of claims 1 to 5, provided that 5-methyl-2,6-bis(1-methylethyl)-1,3-dioxan-4-ol, 2,6-diethyl-5-methyl-1,3-dioxan-4-ol, 2,6-dimethyl-1,3-dioxan-4-ol, 6-hexyl-2-(1-methylethyl)-1,3-dioxan-4-ol, 5,5,6-trimethyl-2-(1-methylethyl)-1,3-dioxan-4-ol, 5,5-dimethyl-2,6-bis(1-methylethyl)-1,3-dioxan-4-ol, 2,6-dibenzyl-5-phenyl-1,3-dioxan-4-ol, 2-ethyl-6-methyl-1,3-dioxan-4-ol, 2-(1-methylethenyl)-1,3-dioxan-4-ol, 6-hexyl-2-(2-octanol-1-yl)-1,3-dioxan-4-ol and 5-ethyl-2,6-dipropyl-1,3-dioxan-4-ol are excluded.

20

12. Use of a compound of formula (I), as defined in anyone of claims 1 to 5, or of a composition as defined in anyone of claims 1 to 6, as a perfuming ingredient or as a precursor capable of liberating a perfuming aldehyde or a mixture thereof.

25

13. A process for the perfuming of a surface or a process for intensifying, prolonging or deferring the diffusion effect of the characteristic fragrance of a fragrant aldehyde on a surface, characterized in that said surface is treated in the presence of a compound of formula (I) as defined in any one of claims 1 to 5.
